

project type

Oncology Addition

location

Goshen, Indiana

client

Goshen Health System

scope

This 48,000 square foot, state-of-the-art cancer treatment facility features two MRI's, two radiography rooms, CATScans, and linear accelerators. The addition's services were coordinated with those of the main hospital.

A combination of standalone systems and extension of existing systems were used on this project. Chilled water is provided by a new air cooled chiller, and a new emergency generator was installed. Steam and medical gases piping for the addition was connected to existing systems.

The absence of existing drawings, a circumstance encountered with some frequency, posed a challenge. This was overcome with greater diligence in performing field investigations and interfacing with hospital staff.

project costs

\$7,400,000

services provided

Structural, Mechanical, Plumbing, Electrical, Construction Administration
